Stiefel manifold: Definition

The (compact) Stiefel manifold $V_{n,p}$ is the set of all p-tuples (x_1, \ldots, x_p) of orthonormal vectors in \mathbb{R}^n .

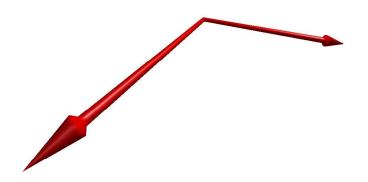

If we turn p-tuples into $n \times p$ matrices as follows

$$(x_1,\ldots,x_p)\mapsto \begin{bmatrix} x_1 & \cdots & x_p \end{bmatrix},$$

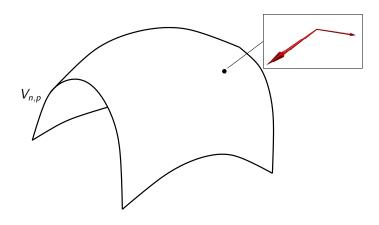

the definition becomes

$$V_{n,p} = \{X \in \mathbb{R}^{n \times p} : X^T X = I_p\}.$$

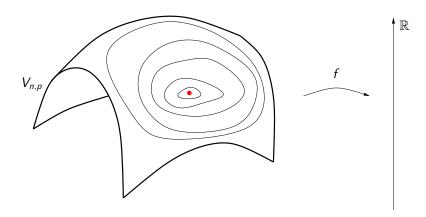

Visualization: an element of $V_{\rm 3,2}$

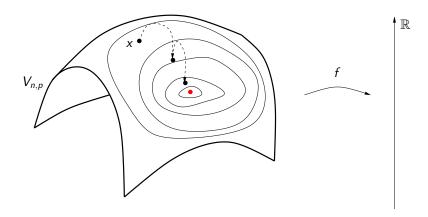

Stiefel manifold: (very unfaithful) artist view

Stiefel manifold: optimization problems

Stiefel manifold: optimization algorithms

Stiefel manifold: Extensions

► Recall: Real case:

$$V_p(\mathbb{R}^n) = \{X \in \mathbb{R}^{n \times p} : X^T X = I_p\} =: V_{n,p}.$$

Complex case:

$$V_p(\mathbb{C}^n) = \{X \in \mathbb{C}^{n \times p} : X^H X = I_p\}.$$

Quaternion case:

$$V_p(\mathbb{H}^n) = \{X \in \mathbb{H}^{n \times p} : X^*X = I_p\}.$$

▶ If *M* is a Riemannian manifold, one can define

$$V_{p}(TM) = \{(\xi_{1}, \ldots, \xi_{p}) | \exists x \in M : \xi_{i} \in T_{x}M, \langle \xi_{i}, \xi_{j} \rangle = \delta_{ij} \}.$$

Stiefel manifold: Particular cases

Recall: Real case:

$$V_p(\mathbb{R}^n) = \{X \in \mathbb{R}^{n \times p} : X^T X = I_p\} =: V_{n,p}.$$

 \triangleright p=1: the sphere

$$V_{n,1} = \{x \in \mathbb{R}^n : x^T x = 1\}.$$

ightharpoonup p = n: the orthogonal group

$$V_{n,n} = O_n = \{X \in \mathbb{R}^{n \times n} : X^T X = I_n\}.$$

Notation

- ▶ E. Stiefel (1935): $V_{n,m}$ (compact), $V_{n,m}^*$ (noncompact).
- ▶ I. M. James (1976): $O_{n,k}$ (compact) Stiefel manifold, $O_{n,k}^*$ noncompact Stiefel manifold, $V_{n,k}$ in the real case, $W_{n,k}$ in the complex case, $X_{n,k}$ in the quaternion case.
- ▶ Helmke & Moore (1994): St(k, n) compact Stiefel manifold, ST(k, n) noncompact Stiefel manifold.
- ▶ Edelman, Arias, & Smith (1998): $V_{n,p}$.
- ▶ Bridges & Reich (2001): $V_k(\mathbb{R}^n)$.
- ▶ Bloch et al.(2006): $V(n, N) = \{Q \in \mathbb{R}^{nN}; QQ^T = I_n\}.$

A glimpse of applications

- ▶ Principal component analysis
- Lyapunov exponents of a dynamical system
- Procrustes problem
- ▶ Blind Source Separation soft dimension reduction

Geometry

- **▶** Dimension
- ► Tangent spaces
- ▶ Projection onto tangent spaces
- Geodesics

Stiefel manifold: dimension

Dimension of $V_{n,p}$:

- ▶ 1st vector: one unit-norm constraint: n-1 DOF.
- ▶ 2nd vector: unit-norm and orthogonal to 1st: n-2 DOF.
- **...**
- ▶ pth vector: n p DOF.

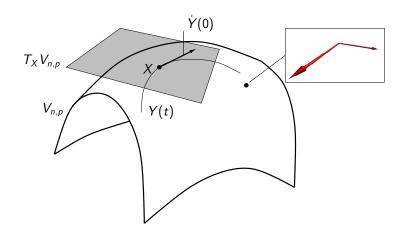

Total:

$$\dim(V_{n,p}) = pn - (1 + 2 + \dots + p)$$

$$= pn - p(p+1)/2$$

$$= p(n-p) + p(p-1)/2.$$

Stiefel manifold: tangent space

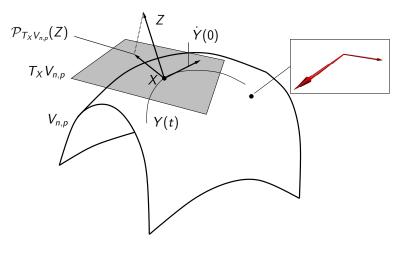

Stiefel manifold: tangent space

Let $X \in V_{n,p}$ and let Y(t) be a curve on $V_{n,p}$ with Y(0) = X. Then $\dot{Y}(0)$ is a tangent vector to $V_{n,p}$ at X. The set of all such vectors is the tangent space to $V_{n,p}$ at X. We have

$$Y(t)^T Y(t) = I_p$$
 for all t $\frac{\mathrm{d}}{\mathrm{d}t}(Y(t)^T Y(t)) = 0$ for all t $\dot{Y}(0)^T Y(0) + Y(0)^T \dot{Y}(0) = 0$ $X^T \dot{Y}(0)$ is skew $\dot{Y}(0) = X\Omega + X_\perp K, \ \Omega^T = -\Omega.$

Hence
$$T_X V_{n,p} = \{ X\Omega + X_{\perp}K : \Omega^T = -\Omega, K \in \mathbb{R}^{(n-p)\times p} \}.$$

Stiefel manifold: projection onto the tangent space

Stiefel manifold: projection onto the tangent space

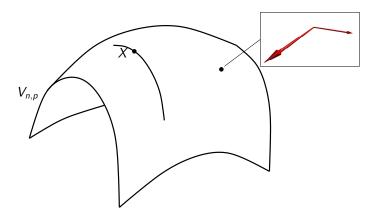

- ▶ Tangent space: $T_X V_{n,p} = \{ X\Omega + X_{\perp} K : \Omega^T = -\Omega, K \in \mathbb{R}^{(n-p) \times p} \}.$
- Normal space: $N_X V_{n,p} = \{XS : S^T = S\}.$
- Projection onto the tangent space:

$$\mathcal{P}_{T_X V_{n,p}}(Z) = Z - X \operatorname{sym}(X^T Z)$$

= $(I - XX^T)Z + X \operatorname{skew}(X^T Z),$

where
$$\operatorname{sym}(M) = \frac{1}{2}(M + M^T)$$
 and $\operatorname{skew}(M) = \frac{1}{2}(M - M^T)$.

Stiefel manifold: geodesics

Stiefel manifold: geodesics

A curve X(t) on $V_{n,p}$ is a geodesic if, for all t,

$$\ddot{X}(t) \in N_{X(t)}V_{n,p}$$
.

Ross Lippert showed that

$$X(t) = \begin{bmatrix} X(0) & \dot{X}(0) \end{bmatrix} \exp t \begin{bmatrix} X(0)^T \dot{X}(0) & -\dot{X}(0)^T \dot{X}(0) \\ I & X(0)^T \dot{X}(0) \end{bmatrix} I_{2p,p} e^{-tX(0)^T \dot{X}(0)}.$$

Stiefel manifold: quotient geodesics

Bijection between $V_{n,p}$ and O_n/O_{n-p} :

$$V_{n,p} \ni X \leftrightarrow \{ \overbrace{[X \ X_{\perp}]}^{U} : U^{T}U = I_{n} \} \in O_{n}/O_{n-p}$$

Quotient geodesics: If

$$U(t) = U(0) \exp t \begin{bmatrix} A & -B^T \\ B & 0 \end{bmatrix}.$$

then $U_{:,1:p}(t) \in V_{n,p}$ follows a quotient geodesic.

Applications

- ▶ Principal component analysis
- Lyapunov exponents of a dynamical system
- Procrustes problem
- ▶ Blind Source Separation soft dimension reduction

- ▶ Let $A = A^T \in \mathbb{R}^{n \times n}$.
- ▶ Goal: Compute the *p* dominant eigenvectors of *A*.
- ▶ Principle: Let $N = \operatorname{diag}(p, p 1, \dots, 1)$ and solve

$$\max_{X^TX=I_p}\operatorname{tr}(X^TAXN)$$

- ▶ A basic method: Steepest-descent on $V_{n,p}$
- ▶ Let $f: \mathbb{R}^{n \times p} \to \mathbb{R}: X \mapsto \operatorname{tr}(X^T AXN)$
- ▶ We have $\frac{1}{2}$ grad f(X) = AXN.
- ▶ Thus $\frac{1}{2}$ grad $f|_{V_{n,p}}(X) = \mathcal{P}_{T_X V_{n,p}}(AXN) = AXN X \operatorname{sym}(X^T AXN)$, where $\operatorname{sym}(Z) := (Z + Z^T)/2$.
- ▶ Basic algorithm: Follow $X = \operatorname{grad} f|_{V_{n,o}}(X)$

- ightharpoonup Let $A = A^T \in \mathbb{R}^{n \times n}$.
- ▶ Goal: Compute the p dominant eigenvectors of A.
- ▶ Principle: Let $N = diag(p, p 1, \dots, 1)$ and solve

$$\max_{X^TX=I_p}\operatorname{tr}(X^TAXN).$$

- ▶ A basic method: Steepest-descent on $V_{n,p}$.
- ▶ Let $f: \mathbb{R}^{n \times p} \to \mathbb{R}: X \mapsto \operatorname{tr}(X^T A X N)$
- ▶ We have $\frac{1}{2}$ grad f(X) = AXN.
- ▶ Thus $\frac{1}{2}$ grad $f|_{V_{n,p}}(X) = \mathcal{P}_{T_X V_{n,p}}(AXN) = AXN X \operatorname{sym}(X^T AXN)$, where $\operatorname{sym}(Z) := (Z + Z^T)/2$.
- ▶ Basic algorithm: Follow $X = \operatorname{grad} f|_{V_{n,p}}(X)$

- ightharpoonup Let $A = A^T \in \mathbb{R}^{n \times n}$.

where $\operatorname{sym}(A) := \frac{1}{2}(A + A^T)$.

▶ Case p = n: Then $f|_{V_{n,p}}(Q) = cst - 2tr(Q'A'B)$, and the solution is given by

$$A^T B = U \Sigma V^T, \qquad Q = U V^T$$

if A^TB is invertible.

▶ Orthogonal Procrustes problem: given $A \in \mathbb{R}^{m \times n}$, $B \in \mathbb{R}^{m \times p}$. find $Q \in \mathbb{R}^{n \times p}$ that solves

$$\min_{Q^T Q = I_p} \|AQ - B\|_F^2.$$

- ▶ Applications: factor analysis, used notably in psychometrics.
- First-order optimality condition à la manifold:

$$f(Q) = \operatorname{tr}(B^{T}B) + \operatorname{tr}(Q^{T}A^{T}AQ) - 2\operatorname{tr}(Q^{T}A^{T}B)$$

$$\operatorname{D}f(Q)[\dot{Q}] = -2\operatorname{tr}(\dot{Q}^{T}A^{T}B) + 2\operatorname{tr}(\dot{Q}^{T}A^{T}AQ),$$

$$\operatorname{grad}f(Q) = -2A^{T}(B - AQ),$$

$$\operatorname{d}f|_{V_{n,p}}(Q) = \operatorname{grad}f(Q) - Q\operatorname{sym}(Q^{T}\operatorname{grad}f(Q)),$$

where sym(*A*) := $\frac{1}{2}(A + A^T)$.

Case p = n: Then $f|_{V_{n,p}}(Q) = cst - 2tr(Q'A'B)$, and the solution is given by

$$A'B = U\Sigma V', \qquad Q = UV'$$

▶ Orthogonal Procrustes problem:

$$\min_{Q^TQ=I_p}\|AQ-B\|_F^2.$$

First-order optimality condition à la manifold:

Consider
$$f: \mathbb{R}^{n \times p} \to \mathbb{R}: Q \mapsto \|AQ - B\|_F^2$$
. We have

$$f(Q) = \operatorname{tr}(B^T B) + \operatorname{tr}(Q^T A^T A Q) - 2\operatorname{tr}(Q^T A^T B)$$
$$\operatorname{D} f(Q)[\dot{Q}] = -2\operatorname{tr}(\dot{Q}^T A^T B) + 2\operatorname{tr}(\dot{Q}^T A^T A Q),$$
$$\operatorname{grad} f(Q) = -2A^T (B - AQ),$$
$$\operatorname{grad} f|_{V_{n,p}}(Q) = \operatorname{grad} f(Q) - Q\operatorname{sym}(Q^T \operatorname{grad} f(Q)),$$

where $sym(A) := \frac{1}{2}(A + A^T)$.

▶ Case p = n: Then $f|_{V_{n,p}}(Q) = cst - 2tr(Q^TA^TB)$, and the solution is given by

$$A^T B = U \Sigma V^T, \qquad Q = U V^T$$

if A^TB is invertible.

► Orthogonal Procrustes problem:

$$\min_{Q^T Q = I_p} \|AQ - B\|_F^2.$$

First-order optimality condition à la manifold:

Consider
$$f: \mathbb{R}^{n \times p} \to \mathbb{R}: Q \mapsto ||AQ - B||_F^2$$
. We have

$$f(Q) = \operatorname{tr}(B^T B) + \operatorname{tr}(Q^T A^T A Q) - 2\operatorname{tr}(Q^T A^T B)$$
$$Df(Q)[\dot{Q}] = -2\operatorname{tr}(\dot{Q}^T A^T B) + 2\operatorname{tr}(\dot{Q}^T A^T A Q),$$
$$\operatorname{grad} f(Q) = -2A^T (B - AQ),$$
$$\operatorname{grad} f|_{V_{n,p}}(Q) = \operatorname{grad} f(Q) - Q\operatorname{sym}(Q^T \operatorname{grad} f(Q)),$$

where $sym(A) := \frac{1}{2}(A + A^T)$.

► Case p = n: Then $f|_{V_{n,p}}(Q) = cst - 2tr(Q^T A^T B)$, and the solution is given by

$$A^T B = U \Sigma V^T, \qquad Q = U V^T$$

if A^TB is invertible.

- Measurements $X = \begin{bmatrix} x_1(t_1) & x_1(t_2) & \cdots & x_1(t_f) \\ \vdots & \vdots & \ddots & \vdots \\ x_n(t_1) & x_n(t_2) & \cdots & x_n(t_f) \end{bmatrix}$.
- ▶ Goal: Find a matrix $W \in \mathbb{R}^{n \times p}$ such that the rows of

$$Y = W^T X$$

look as statistically independent as possible.

$$Y = V^T \underbrace{\Sigma U^T X}_{=:\tilde{X}}.$$

- Whitening: Choose Σ and U such that $\tilde{X}\tilde{X}^T = I_n$. Then $YY^T = V^T\tilde{X}\tilde{X}^TV = V^TV = I_p$.
- Independence and dimension reduction: Consider a collection of covariance-like matrix functions $C_i(Y)$ such that $C_i(Y) = V^T C_i(\bar{X}) V$. Choose V to make the $C_i(Y)$'s as diagonal as possible.
- Principle: Solve

Joint diagonalization on the Stiefel manifold: application

The application is blind source separation.

Two mixed pictures are given as input to a blind source separation algorithm based on a trust-region method on $V_{2,2}$.

Joint diagonalization on the Stiefel manifold: application: input

Joint diagonalization on the Stiefel manifold: application: output
